Independent Advisor | People | Assets | Operations

CAPABILITY STATEMENT 2026

The Supply Chain Is Where Transformation Succeeds or Fails.

Owner-side advisory. No vendor agenda. No SI safety net.

I advise Oil & Gas, Energy and EPC organisations on value chain transformation, procurement governance, enterprise asset management and the data foundation beneath them.

The Problem Boards Are Actually Facing

Most organisations believe they have a supply chain problem. They rarely do. What they have is a data problem, a process problem and a technology problem, all wearing a supply chain mask.

The pattern is familiar. SAP S/4HANA, IBM Maximo and Digital Twin programmes are approved on a promise of transformation. Go-live arrives on schedule. Eighteen months later the plant still runs on spreadsheets, workarounds and the memory of experienced people, because the foundation beneath the system was never built.

> **Vendors will tell you the foundation is ready. It rarely is.**

Supply Chain Is No Longer a Department

In the Industry 4.0 to 5.0 era, supply chain becomes the value orchestration layer of the enterprise. It reaches into every function, Finance, Operations, Maintenance, HSE, HR and Administration, and tightens each one toward optimal performance.

The opportunity is wider than most leadership teams recognise. Pest control, stationery, canteen services, office furniture, staff fleet, travel and training events are routinely bought function by function and site by site. Consolidated into category strategies and framework agreements, that fragmented spend becomes a measurable line in the profit improvement plan. I advise from this position: the value chain as the nervous system of the enterprise, not a support function at the end of it.

From the Client Seat

> **At ZADCO, as Central Island Logistics Lead,** the senior logistics position on an offshore island housing 5,000 people and standing deputy to the Island Manager, I was accountable for every movement of personnel, materials, equipment and contractor crews supporting four simultaneous drilling rigs, on a USD 500M annual logistics budget.
>
> **Material availability stood at 92% on arrival. Within fourteen months it was 99.2%.**
>
> *That outcome was not produced from a consulting deck. It was produced from the chair where the consequences land.*

99.2%	USD 500M	USD 2B+	35%
Material availability	Annual logistics budget accountable	Procurement & CAPEX governed	Planning accuracy gain

Client-side track record across **Shell** | **ADNOC Group (ZADCO)** | **QatarEnergy** | **TotalEnergies** | **Petrofac** | **Crescent Petroleum**

What Sets My Advice Apart

Owner-side, without exception. I am not a vendor, a reseller or a system integrator. I carry no licence targets and no implementation revenue. Every recommendation is made from the client's side of the table.

Value chain thinking, not departmental thinking. Spend, data and process are governed across the whole enterprise perimeter, not within the walls of a procurement department.

Governance engineered into the process. Controls that depend on individual integrity eventually erode. I design controls into the workflow, the Delegation of Authority and the SOP itself.

Foundation before technology. Asset hierarchy, master data and taxonomy discipline come before any AI, Joule or Digital Twin layer is switched on. BDC federates bad data faster. It does not fix it.

Practice Areas

Value Chain Transformation and Operating Model

Operating model redesign that positions the supply chain as the enterprise performance layer. Category strategy, commodity clubbing across sites and functions, and framework agreements that convert fragmented departmental spend into organisation-wide savings.

Procurement Governance and Integrity Architecture

Delegation of Authority designed by vulnerability as well as value: dual approval wherever exposure is high, even at low value, and multi-HOD sign-off on every bid evaluation and Note of Approval. Vendor selection workflows in which no single individual controls the outcome. SOPs with audit checkpoints built in from the first draft. Enforced identically inside the ERP and outside it, because a workaround in one channel invalidates the other.

SAP S/4HANA, SAP Ariba, EAM and IBM Maximo

Owner-side governance of procurement, materials management and plant maintenance implementations, from business case and SI selection through go-live and stabilisation. Hands-on depth across SAP MM, SAP Ariba, SAP PM/EAM, IBM Maximo and SmartPlant Materials.

Master Data Governance and ISO 8000

Functional location and equipment hierarchies, material master cataloguing, deduplication and noun-modifier standardisation across multi-site, multi-country portfolios, including the EPC and supplier data obligations that must be written into contracts long before the data is needed.

Digital Twin, AI and Offshore Logistics

Digital Twin strategy grounded in what the plant actually knows, not what the dashboard reports. AI-enabled demand sensing and predictive maintenance built on governed data. Offshore supply base design, marine and heavy logistics for operations that cannot afford to stop.

Engagement Model

Diagnostic and Roadmap

A focused four to eight week assessment of data, process and governance maturity, closing with prioritised recommendations for the executive committee.

Advisory Retainer

Continuing senior counsel to boards, CEOs, CSCOs and Plant Managers on value chain strategy, programme assurance and vendor negotiations.

Project-Based Mandate

Embedded owner-side leadership of a defined transformation programme, with agreed scope, decision gates and measurable outcomes.

Capability and Integrity Build

Knowledge transfer alongside delivery, including integrity sessions that equip new graduates to hold the line before small deviations become normal.

If you are leading a transformation in Oil & Gas, Energy or EPC and need someone who has done this work at board level across the Middle East, Europe and South Asia, I welcome a direct conversation.
